# THE DIGITAL WAY TO PERFECTION

MIROGLIO TEXTILE has decoded  
the DNA of its colours!

With the technical standard DMIX,  
Miroglio Textile is now in a position  
to identify, identically represent  
and precisely  
reproduce any colour.

Miroglio Textile is  
forging the start of a  
revolutionary digital  
era in evolution.

Building on its traditional competency in developing new technologies for dyeing and printing textiles, together with its international partners,

Miroglio Textile has implemented a ground-breaking new process in digital colour communication.

In a network co-operation with renowned hardware and software developers such as CADDON, EPSON, EFI and Color Digital; DMix - currently the most innovative digital standard in colour communication based on CADDON's multispectral technology - has been successfully developed and applied.

Perfection, from sourcing to production. The molecules making up the colours and patterns are digitally decoded, archived and reproduced in an identical form.

COLOR DNA by Miroglio Textile offers his customers and partners a unique digital forum for the presentation and precise replication of colours, patterns and textiles.
